

SADDLEBACK CIRCUIT PLAN

Planned Work:

- Replace 4.8 miles of existing bare overhead wire with new covered conductor
- Add new weather station near end of the circuit to improve situational awareness

Expected Improvements:

- Work delayed until 2022 pending environmental permits
- When the updates are completed, a **57% reduction** in customer outage time is expected assuming the same weather conditions in 2020
- Additional benefits from that new weather station are also anticipated, but magnitude of benefits is unknown
