

Agricultural and Pumping Interruptible Program (AP-I)

BOOST YOUR BOTTOM LINE WITH YEAR-ROUND BILL CREDITS.

You may be able to enjoy monthly bill credits year-round when you participate in Southern California Edison's (SCE) Agricultural and Pumping Interruptible (AP-I) Program.

The savings are easy with AP-I.

Simply allow SCE to temporarily interrupt electric service during periods of peak energy demand and earn bill credits to lower your energy costs and help improve your bottom line.

AP-I is available to agricultural and pumping customers with a measured demand of 37 kW or greater, or with at least 50 horsepower of connected load. As an AP-I participant, you must already be served under an eligible Agricultural and Pumping Rate Schedule.

Service interruptions are limited and automated for ease.

Upon notification from the California Independent System Operator (CAISO) of the need to implement energy load reductions in SCE's service territory, we will transmit a signal to the load control device installed on your pumping equipment, which will automatically turn off your total load served for the entire duration of the interruption or test event.

AP-I customer load is controlled through SCE's remote-controlled switch only during interruption events. You will need to perform a manual reset of the main circuit breaker or pump controller after each interruption or test event.

An interruption can occur at any time — seven days a week, 365 days a year. Interruption events are limited to:

- One event per day (six hours)
- 25 events per calendar year
- 150 hours per calendar year

Choose your preferred method of event notification.

As an AP-I participant, you may request courtesy notifications of interruption events via email, phone, and/or text (SMS).¹

Note: Use of any of the above courtesy services IS NOT a substitute for installing SCE's AP-I Control Device.
