

## **Big Creek Project 2021 Water Year Outlook**

Southern California Edison values its relationship with the local community and understands the importance of the lakes in the Big Creek system to those enjoying the many recreation opportunities in the area. To help facilitate our partnership with the community, SCE has prepared answers to frequently asked questions. Included with this list is precipitation data from the California Department of Water Resources for the San Joaquin River Basin and a table with the forecasted lake levels for the Big Creek system for the 2021 water year. SCE hopes this helps the community plan for a safe and enjoyable recreation season.

### **How does SCE forecast the levels for the lakes in the Big Creek system?**

The six main lakes on the Big Creek system (Lake Thomas Edison, Florence Lake, Huntington Lake, Shaver Lake, Mammoth Pool Reservoir and Redinger Lake) are fed by snowmelt. Every year, SCE conducts snow surveys and compares the results with government data to determine the amount of water in California's snowpack. These data are put into models to estimate when and how much water will be coming into the reservoirs. SCE uses the models to balance the predicted available water with dam safety, FERC license and contractual requirements, recreation needs, maintenance requirements and forecasted energy demand to develop a plan for each lake. While SCE strives to operate pursuant to its annual plan, forecasts are not guaranteed to be precise and deviations from the projected lake levels may occur.

### **How much rain and snow did we get this winter?**

The April 1 statewide average snow water equivalent for the snowpack was 39% of average. The San Joaquin River Basin specifically measured in at 48% of average on April 1. Due to a second year of drought and other factors, the overall runoff forecast for the San Joaquin River Basin into Millerton Lake is only 34% of normal.

### **Why are Huntington and Shaver lakes at lower levels at certain points in the season?**

This is an extremely dry year and is tracking to be one of the driest on record. As you can see in the lake forecast, there is not enough water to maintain all reservoirs at high levels for the entire recreation season. Most notably, Shaver Lake will remain near its current level for much of the summer season and Huntington Lake will dip below full elevation in late August.

### **What will be the status of the lakes regarding recreation in 2021?**

SCE owns the lands around Shaver Lake and administers recreation sites at that location. Shaver Lake and the facilities operated by SCE are projected to be open for the 2021 season. Other lakes in the Big Creek system are on federal lands and recreation is administered by the U.S. Forest Service. SCE will continue to coordinate with federal, state and local authorities to provide for the health and safety of the public at project reservoirs. For updates on other recreation areas in the Sierra National Forest, please visit <https://www.fs.usda.gov/main/sierra/home>.

### **Where can I find more information about water conditions and lake levels?**

For current water conditions and hydrology information, see the Department of Water Resources Data Exchange Center website: <http://cdec.water.ca.gov>.

Up-to-date lake levels for the Big Creek Project and flow information can be found on SCE's public water flow and levels website: <http://kna.kisters.net/scepublic>.

### **Who can I contact if I have additional questions?**

For more information or updates, please contact our Government Relations Manager:
